

# Instruments for Injection

## PAROJECT®

Injection syringe for intraligamental local anaesthesia.

PAROJECT® is an unintimidating pen style intraligamental syringe with a controlled dosage permitting a slow non-traumatic injection.

- Compact and user-friendly (delicate pen-type design)
- Unintimidating in appearance
- Injects only 0.06 ml. per "click", permitting a slow non-traumatic injection
- Made from high-grade stainless steel
- Can be sterilized by any method
- Material and construction guaranteed for 5 years

**PerioDontal Ligament Anaesthesia PDLA**  
After a short while of practising the intraligamental technique in general facilitates everyday treatments, and saves time. The patient will experience that dental local anaesthesia no longer has to be tantamount to a numb cheek, tongue or lip for several hours. The intraligamental technique is a gain to the dentist as well as to the patient.

### Advantages and Indications

- Immediate onset.
- Profound single-tooth anaesthesia in connection with e.g. simple extractions, cavity preparations, endodontic treatments, etc.
- Overcomes failed conventional techniques - an efficient supplement to insufficient blocks and infiltrations.
- Teeth in more than one quadrant can be treated at the same sitting.
- Gentle pain control due to a very small injection dose.
- No soft tissue numbness.
- Replacement to most palatal injections.
- Substantially reduces the risk of haematoma - important when treating haemophiliac patients (where conventional injection techniques might be contra-indicated).
